

# Same-state diagnostic: original $\pi 0.5$ versus original AEGIS safety layer

(a) Live AEGIS observation  
Codex label  $\rightarrow$  GroundingDINO

(b) Executed EEF trajectory

(c) Simulator clearance

(d) Change in target distance

(e) Translation commands

## ONE COLLISION-CONDITIONED CANARY

Safety  
 $\pi 0.5$  min clearance: -4.27 mm  
+AEGIS min clearance: +31.14 mm  
AEGIS avoided collision: YES

Task  
 $\pi 0.5$  progress: +36.17 mm  
+AEGIS progress: -0.44 mm  
AEGIS task completion: NO  
Joint safety + progress: NO

How  
Motion-command retention: 52.0%  
Realized-path retention: 58.1%  
Safety by stopping: NO

Diagnosis  
AEGIS redirected motion upward/sideways.  
It preserved safety but lost task intention.

Not a general benchmark estimate.  
Evidence: Slurm 28457; SHA 8b7eac5fd374...
